Ok, it may be the case that it just has another name in Belgium and EU, and neuroguide is the most widely used and accepted globally, but the person who did your scan might use something different, its just my giving example, i only go to a person using neuroguide so i know all recordings will be compatible.....

Even if they use other software I would still try and get it if you can.

I just sent an email to my neurologist asking for the complete Neuroguide recordings and I also inquired about possibility to swLoretta and Beam. About swLoretta I already asked around for this in multiple hospitals here in Belgium but no one seems to be using that here.

I dont know, as of what EEGs can show I tend to advise all contacting us to try and have one done, as well they are more easily accessible privately thus avoiding normal Drs like the NHS here in the UK, they also do not always cost an absolute fortune.

I know there has to be at least a good 20 people I know personally who have had this done, many get nothing from them, some get something.....
But they do not always send the reports to us though, its hard to answer your question.

I got the actual brain readings every time I had this done, then you have them and can send them to others doing EEGs for more extensive reports.
Most doing EEG do very limited reports like this one you have sent us, so I wanted much more in depth reports.

I think it also depends on findings, like with me they have found brain issues which I have never had prior to 2020-2021, so they did in depth reports,
I dont know why, when you have had epilepsy so long, they have not done a more in depth report, as I would say you require this far more than I do myself as example,

You can go back to the same person who did our EEG and just ask can they do a more in depth report and if they cannot can they refer you to another who can.
They may charge an additional fee, unsure.

And in terms of recordings, the most globally used software is called neuroguide, so if your EEG was done using this, you get the brian recordings, you can then send them to other Drs also using neuroguide.....And these are for you, you dont have to send them to us at all, this is totally up to you, you are welcome to send things, but its your choice, you dont have to.

I am simply saying I would always try to get the recordings for your own reference, they are typically small sized files, not taking up too much space on a USB pen.
If there are many files they tend to ZIP and compress them,

Another good idea is to ask them to do recordings both with and without artefacts, blinking for example, this is why they ask you to try and not blink,
and do scans with eyes open and closed, or rather they should be doing this, some dont, they tend to remove the artefacts once the scan is done, to read the cleaner results.....

I also learned the hard way doing these things like talking to my perps, and the pain.....as they said afterwards thier readings were poor to judge from, so as much as it is a good idea to try and show things like BCI and V2K, it made it then hard for them to read properly the results, but i didnt really care as i knew id keep having it done.....

You can go back to any of the Drs you've seen and request these, but if too much time has gone by they may not have them by now.

Also we all know Drs can be dodgy, if you have the recordings and get them there and then, meaning on the day the scan is done, they cannot really hide anything.....

this is just what ive picked up at each scan, I hope this helps,

Melanie is away at the moment, but she'll see these emails, and im sure shell contact you when shes the time.

Thanks Alison.

Melanie, let me know how you want to proceed.

Should I ask my neurologist for the larger downloads of the EEG test results? Do you want earlier EEG's or other medical exams as well?

How many different TI's do you have EEG's from?

Grtz,
Stephane

well then that explains it all, and if you were not epileptic from younger aged it may well be the case that targeting is the cause.
Ive no idea, I know nothing much about epilepsy.

It says the words abnormal for one area, but no details, rest normal, so if you have other evidence supporting it, this is what I mean, its great not good for your health, I mean as evidence, can you ask them to complete an in depth BEAM or LORETTA report ? looking at all brain networks then the brian globally ?
You can request they look at the cerebellum, tinnitus network, pain etc.....and sort of tailor it to your personal symptoms.

And yes, I tried to see if I could in essence make the EEG show I am a TI in these ways, as it cannot decipher root cause, I recorded one of my EEG scans, to send the audio to Amy H and see if any corresponding perp radio comms were found. you could try this if you want.

Melanie you should look this person up, and see if the other Drs you are working with know of them etc.....

Hi Alison,

The report says "ABNORMAL EEG". I did indeed explain to my neurologist I'm a TI and that the voices started attacking me in 2017.

I also have more medical reports that point to other problems since I became a TI. An MRI from 2022 shows 4 dots with scar tissue deep inside my brain that were not there on a previous MRI, from micro bleedings and the neurologist also found an abnormality in a scan in an area of the brain associated with possible hallucinations. I have a 24h EEG planned in October. During this EEG I also tried to talk to the v2k voices half of the time.

Since I'm epileptic, I have to do an EEG every year so I have these in my medical file since I was 6 years old.

If we have multiple EEG's from TI's, can we not go and take them for example to my neurologist and explain the truth to him and ask if he can find similarities? I have always been pretty open to my doctors, and gave them info about TI's, this was never really a problem, though I did suspect that my previous neurologist, Prof.Dr. De Raedt, was being mind controlled and had to hide certain things. She

for instance minimized the report from the radiologist about the 4 scars in my brain but she did show them to me on her computer screen.

Let me know what I can do.

Best,
Stephane

Hi,

Thank you for sending this, just to point out,

Unless the person who did this scan for you were to write up a detailed report on the findings, and can state cause is unknown for any abnormalities, sending this as it is to anyone for review or after care treatments may not suffice, as the report says no abnormalities.

Was this neurologist aware you are a TI ? As if yes I think making an introduction to Iicator / Melanie is a good idea it may aid in the TI clinic we are hoping to setup.

As we normally cannot tell Drs the truth, the next best thing is for them to say they dont know the cause of health issues, as they want the root cause to be able to then treat things.

Then even if issues are found, we as victims know etc.....but unless they know about targeting they will think about other causes, and try to label it.

If more health issues were found, they dont run in your family, not as of other causes and have never been detected in you before, then they may start to think of other causes, yet still its unlikely they'll say WIFI etc.....

I had 5 EEGs done now and experimented, for one I sat there motionless and decided to actually engage in chit chat with my V2K to see if in the reads anything strange was noted, it was noted my brain was over occupied during the scan, but it does not prove v2k. For another I tried to see if physical attacks were noted in brain readings, and the pain network was through the roof, so it showed how much pain I was in at the time, but it will not get noted as a BCI CNS type weapons attack, it will be read as if I am normally in general pain for whatever reason. Which I am due to migraine issues, so while it may note pain it cannot decipher the cause of the pain in this sense.

If we cannot tell Drs the truth, we hope for the next best thing - no cause known, then use things in legal cases like the icator case, where hundreds of others have similar reports etc..... To begin my own Drs went through all the typical options for causes, this is down to gluten, lifestyle, environment, have you been in a car accident and had head injury, is it genetic..... No, no explanation whatsoever.

I would repeat the scan every 1-2 years, to show things are ongoing, worse or remain the same, and I would ask for copies of the actual brain reads from the software, taking with you to the scan a USB pen to store them on. This way you have them, can refer back to them, and send them to other EEG specialists if required. I would then have a battery of blood tests done, and see if other things are detected.

If you could let Melanie know as if they understood and believed you are a TI it is great.

Regards
A

Hi Alison, Melanie,

This is also useful for Icator I'm hoping.
I already sent Melanie a whatsapp msg about this.

Targeting is heavy since a while. I'm struggling here.
If you have time also have a look at the many articles I published the last few months on x: <https://x.com/stepvda/articles>

Best,
Stephane

Hi,

Please find the EEG results that I had last month: <https://x.com/stepvda/status/1952310390869684496>

The EEG shows an abnormal result that might be an indication of v2k and synthetic telepathy. I'm a TI and been under constant attack since 2017. On x.com/stepvda you can find more about my TI insights.

Kind regards,
Stephane van der Aa
